IDentify

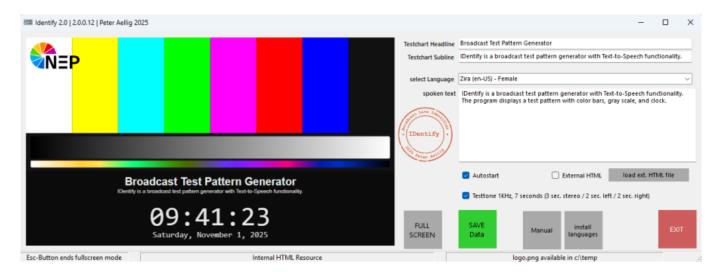

Overview

Identify is a broadcast test pattern generator with text-to-speech functionality.

The program displays a test pattern that includes color bars, a grayscale ramp, and a real-time clock. It features an internal test image, two freely configurable text lines, and optionally allows you to integrate your own logo.

Alternatively, you can use your own HTML files—examples of these can be found in the download folder.

The program runs on Windows 10 or 11 (64-bit). It includes an embedded manual that also explains how to install additional languages. While not all available languages are supported, the manual describes the most common ones that work.

Download HERE

There are a few HTML examples in the download folder.

If you want to add your own logo to the internal test image, use a 1920×1080 transparent image that contains your logo in the desired position and size.

If you want to add your logo to the station clock, convert your logo into BASE64 code and insert it into the HTML code.
